

Phase 1 Final Integration/ Amendments 10.07.26

Titling: "Circularity & Mobility Integration" doesn't work, please change to. "Facilities for Sustainable Behaviours"

Gauge Components to Half-Circles

- Visual inconsistency where the first column cards (*Environmental Quality / Sustainability Performance*) use **half-circle** semi-gauges, while the second column cards (*Public Realm... / Community Wellbeing...*) use **full-circle** rings.
- Standardize all 4 dialect/sentiment gauge components to use the half-circle (semi-gauge) design.
- **Implementation:**
 - Convert the gauges for **Public Realm, Safety & Accessibility** and **Community Wellbeing & Belonging** to match the 180° semi-circle radius
 - Ensure the center-aligned numeric score rests cleanly on the baseline of the half-arc.
 - Unify the stroke thickness, color profiles, and animation across all 4 gauges.

UI Elements: Add a distinct threshold marker line to the 4 half circle dials at the point we've decided is "green/high outcome"

- Red/ Green Dial. I've revised the data [attached] so that one of the dials comes out green and one comes out red. Hopefully that is easy to reintegrate

Linear Bar Styling

Update the newly titled "Facilities for Sustainable Behaviours" card (top right) so its linear bar matches the exact styling, height, track and formatting of the "Operational Housing Affordability" linear bar (bottom right). It should show up red.

Lay out lock: Lock the grid layout using CSS Flexbox or Grid. Tell them to explicitly group the cards so that the 4 multi-option "Dial" metrics sit on the left, and the 2 binary "Linear" metrics sit stacked vertically on the right.

Regardless of screen scaling on the Surface Pro, it must lock to a 3-column, 2-row layout or a responsive vertical stack where the linear bars stay paired:

Column 1: Environmental Quality (Top) / Sustainability Performance (Bottom)

Column 2: Public Realm Safety (Top) / Community Wellbeing (Bottom)

Column 3 (The Binary Stack): Facilities for Sustainable Behaviours (Top) / Operational Housing Affordability (Bottom)

On mobile view/ narrow windows. They should stack as a column; 4 dials followed by the two linear bars,

Primary Demand Dials

- Introduce a new circular KPI dial at the top of the Construction Sites Page, Build to Sell Page, and Build to Rent (BTR) Page.
- Placement: Position this card alongside the existing top-row header metrics to maintain visual consistency across all three layouts.
- Dynamic Labeling Logic:
 - On the Build to Sell and Build to Rent (BTR) Pages, label the header: **Primary Occupier Demand**
 - On the Construction Sites / Field Survey Page, label the header: **Primary Community Demand**
- UI Specifications:
 - Primary Data Display: Display the top-voted item name prominently as a text label (e.g., **Community/ Meanwhile Events**).
 - Fraction Display: Beneath or alongside the primary text, display the respondent ratio as a fraction (e.g., **3/17**) in place of a standard point score, utilizing the same typography as the neighbouring cards and standard circular dial framework, matching the layout, borders, and styling of the other fluid community sentiment cards.

Sentiment Distribution cards

Discrepancy between the main KPI page and the one shown in the qualitative deep dive section. Perhaps introduced because of manual tagging.

- The raw numbers for **Positive (19)** and **Neutral (21)** match across both components.
- However, the **Negative** count drops from **31** (on the main page) down to **14** (in the deep dive), which breaks the total response count (**71 responses** vs. **54 responses**) and skews the percentages.

Ensure both components are querying the exact same state/databases so that the distribution is completely unified across both views. If this is currently hardcoded mock data for the demo, please update the deep dive component to match the 71 response total: 19 Positive, 21 Neutral, 31 Negative).

Align "Export PDF" Button

- The "Export PDF" button is vertically misaligned and looks like it is floating higher than the adjacent filter dropdown components.
- Align the "Export PDF" button to match the vertical center/baseline of the **Age Bracket**, **Asset State**, and **Tenure** dropdown elements.
- Ensure the outer toolbar wrapper uses a single flex container to lock the dropdowns and the button horizontally.

Update Sidebar Header (SOSC_int Placeholder)

- Replacement: Above Data monitoring add a bold, black font colour text placeholder for the new platform name: **"SOSC_int"**
- Rename the text **DATA MONITORING** as **PORTFOLIO MONITORING**
- Styling and Logo Assets to be developed in Phase 2 by others.

New Descriptors:

Add a text block at the base of each of the 6 KPI cards to display its operational definition.

- Placement: Hardcode the text into a new bottom bar/footer element inside each card, positioned running full-width beneath the existing cards
- Set font size to be smaller than the main card text but still legible. Serving as subtext.
- Potential to use an off-grey so the copy adds context without competing with the primary KPI numbers. Ensure the text wraps cleanly across a maximum of 2 to 3 lines within the bottom padding of the card.

1. Environmental Quality

Evaluates street-level environmental health, focusing on impacts of construction sites in terms of acoustic comfort, air purity, and local cleanliness. Identifies localized efforts to mitigate construction impact and enhance the physical environment.

2. Sustainability Performance

Benchmarks tenant and occupier understanding of how to use a development's built-in sustainability and energy-efficiency features, adding crucial human operational data to traditional green targets and forecasting.

3. Public Realm, Safety & Accessibility

Measures the inclusivity, physical security, and pedestrian infrastructure surrounding development and construction sites. Also measures awareness of physical spaces, parks and open spaces created by the developer in the local area.

4. Community Wellbeing & Belonging

Indexes localized social equity and community cohesion by tracking resident awareness and attendance of developer-organized wellness initiatives, neighborhood events, and hosted community activations.

5. Facilities for Sustainable Behaviours (Linear Bar 1)

Tracks the tenant and occupier awareness of and use of green amenities like EV charging, waste hubs and cycle storage. Measures how effectively the physical asset infrastructure enables zero-carbon daily habits.

6. Operational Housing Affordability (Linear Bar 2)

Monitors occupier sentiment regarding the predictability and manageability of combined ongoing costs of rent, service charges, and energy utilities. Acts as an early warning for economic stress and tenant churn risk.
